Career Objective

Full Stack Developer focused on building and shipping web applications end-to-end, with hands-on experience across the entire stack, from database design to deployment. Experienced in owning projects from development through to production, including authentication, relational data design, and payment integrations across multiple systems. Seeking to join a collaborative engineering team to contribute to real-world products, while working toward a longer-term goal of growing into DevOps and infrastructure work.

Skills

- **Languages:** Python, JavaScript, TypeScript, C, C++
- **Frameworks & Libraries:** Express.js, React, Next.js, Django, Node.js, Tailwind CSS, TanStack Query, Zod
- **Databases & ORM:** PostgreSQL, MySQL, MongoDB, Redis, Prisma
- **Auth, Security & Payments:** JWT, Google OAuth, Role-Based Access Control (RBAC), Stripe, bKash
- **Web Technologies:** REST APIs, JSON, HTML, CSS, Cookies
- **Tools & Platforms:** Git, GitHub, Postman, VS Code, Vercel, Render
- **Soft Skills:** Problem Solving, Communication, Teamwork, Adaptability, Quick Learner

Projects

CareNest — Childcare & Transport Booking Platform Live Link – Server – Client

A full-stack platform where guardians book supervised childcare and transport run by admin-verified staff, replacing informal arrangements with an auditable system for bookings, verification, and payments.

- **Room Booking with Fair Waitlisting:** Guardians browse admin-verified rooms and book seats instantly; when a room is full, the request joins a weighted waitlist — ranked by wait time, care tier, and cancellation history — that auto-promotes the top guardian the instant a seat is cancelled.
- **In-App Wallet & Secure Payments:** Guardians top up an in-app wallet through bKash Tokenized Checkout; funds are credited only after the backend independently verifies the transaction with the gateway, with every movement recorded to an auditable ledger.
- **Verified, Trustworthy Staff:** Sitters and drivers authenticate via JWT and Google OAuth and must pass admin review of an uploaded ID document, enforced through role-based access control, before they can be assigned to a room.
- **Role-Based Next.js Client:** Guardian, staff, and admin dashboards with cookie-based sessions, route guards, a multi-step booking wizard, and optimistic updates.

Tech: Next.js, React, TypeScript, Tailwind CSS, TanStack Query, Node.js, Express, PostgreSQL, Prisma, Redis, JWT, Google OAuth, Zod, Cloudinary

Disaster Relief Platform — Emergency Coordination System Server – Client

A relief coordination platform connecting disaster victims, volunteers, and NGOs, replacing manual phone- and radio-based dispatch with tracked, location-aware requests.

- **Geolocation-Based Smart Allocation:** Victims raise an SOS request that is automatically matched to the nearest available volunteer using MongoDB's geospatial `$near` queries, replacing manual dispatch with proximity-based routing.
- **Live Rescue Tracking:** Volunteer location and task status update in real time via polling and render on a React-Leaflet and OpenStreetMap view, so victims and admins can follow a rescue as it happens.
- **Admin Analytics Dashboard:** A four-chart analytics dashboard (Recharts) surfaces incident trends, response times, and resource distribution for admins overseeing the response.

Tech: React, Node.js, Express, MongoDB (Mongoose), JWT, React-Leaflet, Recharts, Nodemailer

FixItNow — Home Services Marketplace API Live Link – Server – Client

A full-stack home services marketplace connecting customers, technicians, and admins through role-based booking, scheduling, and payment workflows.

- **One-Click Service Booking:** Customers book a home repair service and get matched with an available technician, with the full scheduling pipeline exposed through a RESTful API.
- **Trustworthy Checkout:** Payments run through Stripe Checkout with server-side webhook confirmation, so a booking is marked paid only once Stripe's callback verifies the transaction, never on the client redirect alone.
- **Scoped Access for Every Role:** Customers, technicians, and admins each get an account scoped to exactly what they're allowed to see and do, enforced with JWT authentication and fine-grained RBAC.

Tech: Node.js, Express, TypeScript, PostgreSQL, Prisma, Stripe, Next.js, React, Tailwind CSS, Zod

Education

B.Sc in Computer Science and Engineering *Graduated*

BRAC University

Thesis: A Security Evaluation Framework for Distributed Retrieval-Augmented Generation Systems

Languages: Bengali (Native) | English (Professional Working Proficiency)
