PROFESSIONAL SUMMARY

Backend-focused Software Engineer with hands-on experience in building scalable RESTful APIs using Django and Node.js. Strong foundation in database design (PostgreSQL, MongoDB) and API development. Passionate about writing efficient backend systems, optimizing performance, and solving real-world problems through clean and maintainable code.

EDUCATION

B.Sc in Computer Science and Engineering

Expected Graduation: 2026

BRAC University

Thesis: Privacy-Preserving Retrieval-Augmented Generation (RAG)

TECHNICAL SKILLS

Programming Languages: Python, JavaScript, C, C++

Frameworks & Libraries: Django, React, Node.js, Express.js

Databases: MySQL, PostgreSQL, MongoDB

Web Technologies: REST APIs, JSON, HTML, CSS

Tools & Platforms: Git, GitHub, VS Code

Core Concepts: Data Structures, Algorithms, Database Design, Backend Development, API Development, CRUD Operations, MVC Architecture

PROJECTS

Auction Alley - Online Auction Platform

🔗 github.com/Hr-D-LuffY/Auction-Alley

- **Problem:** Traditional auction systems lack real-time bidding capabilities and secure transaction processing for online users
- **Solution:** Built full-stack auction platform with real-time bidding functionality and integrated secure payment gateway
- **Core Architecture:** Designed modular system with user authentication, auction management, bidding engine, and payment processing modules tested across multiple browsers

Disaster Relief Platform - Emergency Coordination System

🔗 github.com/Hr-D-LuffY/disaster-platform

- **Problem:** Disaster response is fragmented across phone calls and spreadsheets, leaving victims without a fast, reliable way to reach aid organizations and volunteers during emergencies
- **Solution:** Built a MERN-stack relief coordination platform connecting victims, volunteers, and aid organizations through role-based dashboards for real-time request tracking
- **Core Architecture:** Implemented a Node.js/Express REST API backed by MongoDB, with a React front-end enforcing role-based access across three distinct user types and a request-routing system linking victims to nearby responders

Dev-Pulse - Developer Productivity Tracker

🔗 github.com/Hr-D-LuffY/Dev-Pulse

- **Problem:** Developers lack lightweight tools to understand their own work patterns, such as focus time and context switching, without manually logging activity
- **Solution:** Built a TypeScript-based productivity tracker that surfaces workflow insights and highlights trends in daily development activity
- **Core Architecture:** Designed a data model to capture and categorize developer activity, paired with a REST API layer and a chart-based dashboard for visualizing trends over time
